# Annual Water Quality Report

Reporting Year **2021**

City of  
**Gregory**

PWS ID NUMBER: TX2050001

361-643-6562

## Your 2021 Annual Water Quality Report

The City of Gregory Water is providing this annual Drinking Water Quality Report to tell you about the quality of the water and how it compares to the guidelines set by the U.S. Environmental Protection Agency (EPA). All drinking water providers are required by federal law to issue annual quality reports like this one to their customers.

Most importantly, we want you to know that when you drink tap water from our system, you are drinking clean high-quality water that meets strict government standards. This report will help you understand the steps taken every day by our experienced staff to deliver the safe drinking water that is essential to human survival.

Many people are surprised to learn that all drinking water, even bottled water, is likely to contain some level of contaminants. The presence of contaminants does not necessarily mean that the water poses a health risk. For more information about contaminants and potential health effects, please call the EPA's toll-free Safe Drinking Water Hotline at **1-800-426-4791**.

Many constituents (such as calcium sodium or iron), which are often found in drinking water, can cause taste color and odor problems. These are known as secondary constituents, and they are regulated by the State of Texas, not the EPA. These constituents are not necessarily causes for health concern. Therefore, they are not required to be reported in this document, but they may affect the appearance and taste of your water.

**For information regarding  
This report, please contact:**

**Norma S. Garcia  
City Secretary  
361-643-6562**

## Public Participation Opportunity

**You can learn more about your water system, offer your comments and present questions at the Gregory City Council meetings held at 6:30 p.m. on the 1st and 3rd Monday of every month at the Gregory Housing Authority, 103 Garango Street.**

### Health Information for Lead

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water comes primarily from materials and components associated with service lines and home plumbing. We are responsible for providing high quality drinking water, but we cannot control the variety of materials used in plumbing components. If your water has been sitting for several hours, you can minimize the potential lead exposure by flushing your tap for 30 seconds to 2 minutes before drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

The TCEQ completed an assessment of your source water and results indicate that some of your sources are susceptible to certain contaminants. The sampling requirements for your water system are based on this susceptibility and previous sample data. The Lead and Copper Rule protects public health by minimizing lead and copper levels in drinking water, primarily by reducing water corrosion. For more information on source water assessments and protection efforts at our system, contact **Norma S. Garcia, City Secretary at 361-643-6562**.

Este reporte incluye información importante sobre el agua para tomar. Para asistencia en español, favor de llamar al telefono **361-643-6562**.

# Sources of Drinking Water

The sources of drinking water is surface water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPAs Safe Drinking Water Hotline at (800) 426-4791.

### Contaminants that may be present include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife
- Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential use
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production and can also come from gas stations, urban storm water runoff, and septic systems
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. You may be more vulnerable than the general population to certain microbial contaminants, such as Cryptosporidium, in drinking water. Infants, some elderly, or immunocompromised persons, such as those undergoing chemotherapy for cancer; persons who have undergone organ transplants; those who are undergoing treatment with steroids; and people with HIV/AIDS or other immune system disorders can particularly be at risk from infections. You should seek advice about drinking water from your physician or health care provider. Additional guidelines on appropriate means to lessen the risk of infection by Cryptosporidium are available from the Safe Drinking Water Hotline at 1-800-426-4791.

# 2021 ANNUAL WATER QUALITY REPORT

To protect public health, the EPA has identified acceptable level for constituents in tap water. The TCEQ has assessed out water system and determined that our water is safe to drink. All constituents in our water are well below the federal and state maximum containment levels. The following table of contains the chemical constituents found in drinking water coming the **San Patricio Municipal Water District** water filtration and treatment complex located between Gregory and Ingleside. The EPA requires all water systems to test for up to 97 constituents.

Year	Constituent	Amt Avg.	Max. Detect Range	Max. Level	Contaminant Goal	Possible Source of Constituent
<b>REGULATED CONSTITUENTS – INORGANIC</b>						
2021	Fluoride (ppm)	0.680	0.095-1.195	4	4	Water additive which promotes strong teeth.
2021	Nitrite (ppm)	0.005	0-0.007	1	1	Runoff from fertilizer; natural deposits.
<b>UNREGULATED CONSTITUENTS (at entry point of distribution system)</b>						
2021	Bromoform (ppb)	13.2	5.4-27.6	N/A	N/A	By-product of drinking water disinfection
2021	Bromodichloromethane(ppb)	7.88	1.7-17.0	N/A	N/A	By-product of drinking water disinfection
2021	Dibromochloromethane(ppb)	13.1	6.8-21.0	N/A	N/A	By-product of drinking water disinfection
2021	Chloroform (ppb)	2.71	0-7.3	N/A	N/A	By-product of drinking water disinfection
<b>TURBIDITY</b>						
2021	Turbidity (NTU)	0.089	0.035-0.195	0.30	0.30	N/A Soil runoff (no health affect)

### COLIFORMS

2021 There were no positive monthly samples for coliform bacteria. (No fecal coliform or E. Coli bacteria detected)

**Nitrate Advisory** – Nitrate in drinking water at level above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may raise quickly for short periods for time because of rainfall or agricultural activity. If you are caring for an infant, you should ask advice from your health care provider.

### 2021 Water Quality Test Results

Disinfectants and disinfectant by-product	Collection Date	Highest Level Detected	Range of Levels Detected	MCLG	MCL	Units	Violation	Likely source of contamination
Haloacetic Acids (HAA5)	2021	29	6.5-39	No goal for the total	60	ppb	N	By-product of drinking water disinfection
Total trihalomethanes (TTHM)	2021	77	60-109	No goal for the total	80	ppb	N	By-product of drinking water disinfection
*The value in the Highest Level or Average Detected column is the highest average of all HAA5 and TTHM sample results collected at a location over a year.								
Inorganic contaminants	Collection Date	Highest Level Detected	Range of Levels Detected	MCLG	MCL	Units	Violation	Likely source of contamination
Nitrate [measured as Nitrogen]	2021	1	0.87-0.87	10	10	ppm	N	Runoff from fertilizer use; Leaching from septic tanks, sewage, Erosion of natural deposits

Lead and Copper	Date Sampled	MCLG	Action Level (AL)	90 <sup>th</sup> Percentile	# Sites Over AL	Units	Violation	Likely Source of Contamination
Copper	09/04/2019	1.3	1.3	0.144	0	ppm	N	Erosion of natural deposits; Leaching from wood preservatives; Corrosion of household plumbing systems.

### Disinfectant Residual

Disinfectant Residual	Year	Average Level	Range of Levels Detected	MRDL	MRDL G	Unit of Measure	Source in Drinking Water
Chlorine	2021	4.82	2.62-5.85	4	<4	ppm	Water additive used to control microbes

Contaminants may be found in drinking water that may cause taste, color, or odor problems. These types of problems are not necessarily causes for health concerns. For more information on taste, odor, or color of drinking water, please contact the system's business office.

**Your Drinking Water Is Safe**
